

Notes for the Start-Up of CADISON R7.1.0

## 1. Licensing

Upon an update from CADISON 7.0.0 / 7.0.1 to CADISON 7.1, it can happen that an already existing CADISON licensing does not work any more, and that also no demonstration period is provided. This mainly happens on computers, which have several network cards installed. In such a case, please perform the update only during the business hours of ITandFactory.

Furthermore, you should keep your existing license file (xml) at hand during an update because this file must be newly re-loaded during the update of a locally registered workplace.

## 2. ISOGEN Version

Due to technical problems, ISOGEN version 5.2.2 shall be held at hand for this CADISON version. This ISOGEN version is not provided as described in the documentation. Presently, the version 5.2.2 is included within CADISON 7.1.

Thus, CADISON 7.1 does not support the new functionality „Symbol Key Designation for Drives“, as documented.

## 3. Support of the Copy&Paste Function Within AutoCAD

This version of CADISON supports the use of the copy&paste function within AutoCAD. Thus, the graphics of one drawing may be copied /pasted into another drawing.

If this function is simultaneously used with the copying option “Enable Automatic Merge”, the new Designer function “Paste Object to Line” cannot copy all elements any more and paste the merged pipe line.

Generally, the support of the copy&paste functionality was mainly tested by using plant-engineering drawings (P&ID, 3D layout plan). For other drawing types, it can happen that the results must manually be re-edited upon performing copying.

## 4. CSV Import into an Existing Object Table Within MATPIPE

Under certain circumstances, the import of a CSV file into an existing object table does not work during the initial attempt. It can happen that the imported data are thrown out.

The problem appears mainly to happen if several CSV files are imported into a catalog in sequence. For this reason, we recommend to close and re-open the catalog again upon import of a CSV file.

## 5. Registration Demand

For computers that only have an NVidia network card installed (onboard network cards), it can happen that no code is generated upon a registration demand under certain circumstances. In such an emergency case, another network card must be installed into the respective computer.
